Separators Heater treaters and Pressure in Oil Gas

Controlling the height of the water column in the heater-treater is an important aspect of using the heater treater. The level of water should be about one foot above the fire tube. In other words, water fills the space from the bottom of the tank to one foot above the fire tube, with oil above that. As oil flows from the inlet tube and up, it will flow past and around the fire tube.

Heater Treaters and Flash Gas Recovery Hy Bon

Heater Treaters and Flash Gas Recovery. February 29, 2016. Heater treaters can be significant sources of flash gas from oil and gas production facilities. Flash gas is natural gas that is released from a wellstream when the liquid undergoes a pressure drop or when the liquid's temperature is increased. In the treater, the crude oil/condensate and produced water experience a pressure drop. <http://countydivorcerecords.co/Heater-Treaters-and-Flash-Gas-Recovery-Hy-Bon.pdf>

Emulsion treating methods petrowiki org

Flash systems use the excess heat in the oil that is received from the treater or treating system and convert it to latent heat at or near atmospheric pressure. A surface condenser condenses the flashed steam in the cooler, incoming stream of raw crude, thus scavenging the excess heat that ordinarily would be wasted.
